

# Making the Chicago Cubs *Shiny*

Gage Sonntag

MMA '18 Queens University

# Agenda

- ▶ Today's Goals
- ▶ What is Shiny?
- ▶ Some Shiny Examples
- ▶ Designing Shiny
- ▶ The Cubs Dataset
- ▶ Building our UI
- ▶ Building our Server

# Today's Goals

- ▶ Understand what Shiny is, why it is a useful tool for your toolbox
- ▶ The structure of a shiny app
- ▶ Web Scraping
- ▶ Build a simple shiny app to look at data on the Chicago Cubs

# What is Shiny?

- ▶ A web application framework for visualization

- ▶ Well Supported community
  - ▶ <https://shiny.rstudio.com/>

# Some Shiny Examples

- ▶ A great gallery of examples, including code!
  - ▶ <https://shiny.rstudio.com/gallery/>
- ▶ Can do simple exploratory analysis
  - ▶ <https://shiny.rstudio.com/gallery/movie-explorer.html>
- ▶ Can be used for automated reporting
  - ▶ [http://shiny.datacamp.com/rmarkdown-apps/rmarkdown\\_1.Rmd](http://shiny.datacamp.com/rmarkdown-apps/rmarkdown_1.Rmd)
- ▶ Or utilize some interesting features of ggplot
  - ▶ [https://gallery.shinyapps.io/college\\_explorer-master/](https://gallery.shinyapps.io/college_explorer-master/)

# *Git* some data to visualize

- ▶ Lets scrape data to visualize from Baseball Reference
  - ▶ <https://www.baseball-reference.com/teams/CHC/2016.shtml>
- ▶ Fork my repository that has already done the hard work
  - ▶ <https://github.com/16gs24/MMA-2018-Shiny-Workshop>

# Designing Shiny

## Server

- ▶ Provides code to convert our inputs to outputs
- ▶ Filters and transforms data into summary statistics a plot

## UI

- ▶ "Control Widgets" are what the user interacts with
- ▶ The order of things on the screen

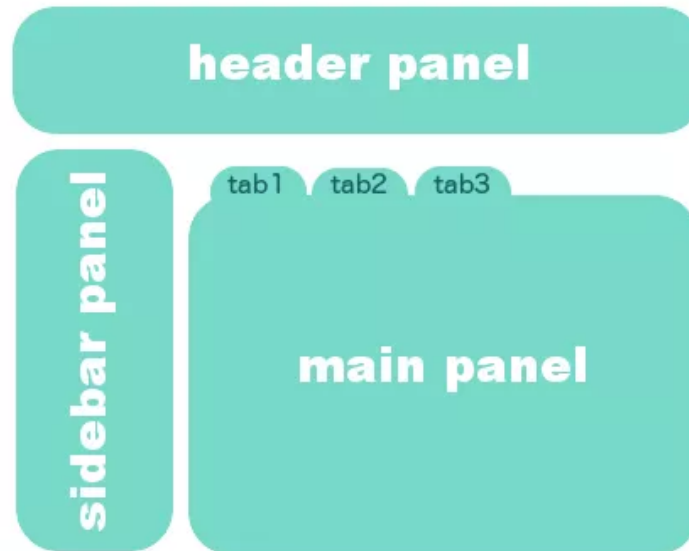

Every Shiny app is maintained by a computer running R

# UI

- ▶ The framework for where objects appear
- ▶ Consider this HOW we select our inputs and WHERE our outputs get rendered

- ▶ One potential direction:

# Server

- ▶ The control link between our inputs and outputs
- ▶ Three Rules:
  - ▶ Save outputs as `output$`
  - ▶ Render the outputs with `render*()`
  - ▶ access inputs with `input$`

# Sidenote: Terminology

- ▶ **Reactivity:** Shiny can dynamically change our output as you adjust inputs, or wait until you select a button. Good for drop downs, bad for text boxes.
- ▶ **FluidPage:** Makes our layout reactive to the dimensions of the web page

# Putting It All Together

- ▶ Begin with a template:

```
library(shiny)
ui <- fluidPage()

server <- function(input, output) {}

shinyApp(ui = ui, server = server)
```

- ▶ Build out with consideration of INPUT & OUTPUT

# Summary

- ▶ In a few short hours we:
  - ▶ Pulled data from the web
  - ▶ Filtered, & feature engineered it.
  - ▶ Built some visualizations to explore why people come to baseball games
